

Figure 1 is a line graph showing the survival curves for four groups of mice: control (blue), 100 mg/kg (red), 200 mg/kg (yellow), and 400 mg/kg (green). The x-axis is labeled 'Age at death (days)' and ranges from 0 to 120. The y-axis represents survival probability. All groups show a sharp decline in survival between 30 and 60 days. The 400 mg/kg group shows the earliest and steepest decline, while the control group shows the latest and least steep decline.
